

Intelligence for Mission IT

Joint & combined operations capability enablement for the digital battlespace

Benefits for defense organizations

- **Joint and combined capability enablement.** Connect heterogeneous technologies and partner/allied systems through a common operational layer.
- **Faster mission readiness.** Shorten the time between a mission plan and the orchestration and verification of supporting services.
- **Improved operational resilience.** Automate resilient operations and prepare alternate communication paths and resource options (PACE) to reduce mission-support risks.
- **Sustained decision superiority.** Provide timely, AI-augmented information to commanders and authorized C2 systems.
- **Reduced mission risk**. Support mission planning with deterministic resource and capacity reservations, proven automation, and AI agents operating within defined guardrails.
- **Accelerated capability delivery.** Build on a mature dual-use platform rather than reinventing operational workflows.

Deploy for your security posture

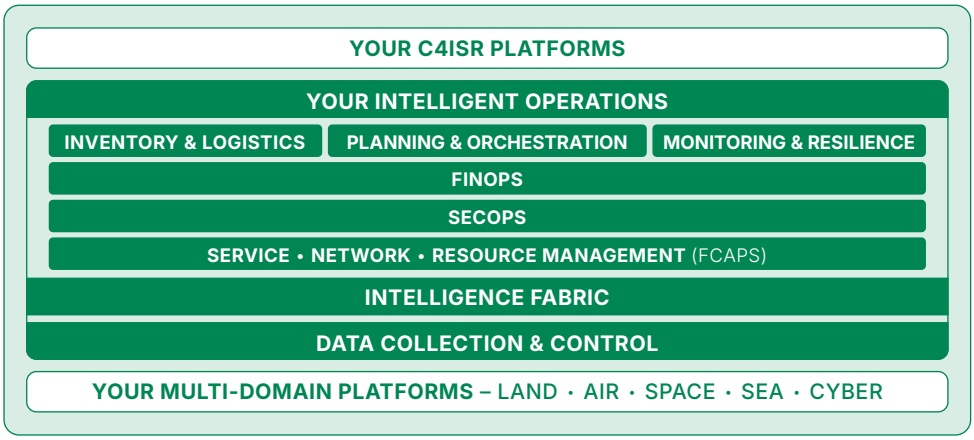

- **Air-gapped on-premises or private data center.** For isolated or highly secure defense environments.
- **Hybrid.** For missions combining local execution connected to the cloud.
- **Cloud-hosted.** Where security policies and mission requirements permit managed cloud operations.

Protect your secret information and configure the platform with your own teams or approved systems integrators.

Essential capability for joint and combined operations

DataMiner is an intelligence and operations platform for mission IT and supporting infrastructure. It complements existing command-and-control and mission command systems without replacing military decision-making authority.

PROVEN TECHNOLOGY. FRESH THINKING FOR DEFENSE.

DataMiner xOps integrates the systems that enable missions into a single intelligence fabric, eliminating operational silos across the ecosystem and avoiding vendor lock-in.

Data collection & control

Leveraging proven dual-use technology, DataMiner brings heterogeneous infrastructure together into a single, open platform:

- Satellite anchor stations, satellite control gateways, baseband, TT&C, RF systems, and payloads
- Virtualized infrastructure, on-premises and in the cloud
- Critical infrastructure and tactical networks
- Deployable systems for land, air, and sea operations
- Sensors and effectors of any type
- IT networks
- Compute, edge and cloud infrastructure, virtual network functions (VNFs), and workloads

The intelligence fabric

A comprehensive digital twin of your operations, enriched with AI/ML-driven behavioral insights and contextual knowledge for agentic AI.

Vendor-agnostic and open service, network, and resource management

Full FCAPS capabilities across all operational layers and technologies, whether deployed on-premises, in the cloud, or at the edge.

SecOps at the center of every workflow

DataMiner significantly reduces the cyberattack surface, provides fine-grained authentication and authorization, and enables automated enforcement of security policies.

Foundational to your essential operational workflows

- **INVENTORY:** Facility and asset lifecycle management, resource and service catalogs and inventories, automated network discovery, and connectivity monitoring.
- **MISSION AND SERVICE PLANNING & ORCHESTRATION:** Deterministic planning of missions, services, resources, and capacity, combined with automated orchestration and mission teardown.
- **MONITORING AND RESILIENCE:** Active and passive data collection, alarm and incident detection, and AI/ML-driven anomaly detection. Automated resilience workflows, including the activation of PACE scenarios.

Your intelligent operations

A single pane of glass providing visibility across your entire operation, supported by agentic AI to:

- **UNDERSTAND** the operational landscape faster and more comprehensively.
- **ACT** by executing operational workflows in a controlled manner.
- **EVOLVE** operational capabilities continuously.

Open APIs to your C4ISR systems

DataMiner provides open APIs for seamless data ingestion and exchange with C4ISR and other enterprise systems, ensuring interoperability without vendor lock-in.

You're in good hands

Skyline Communications does one thing: DataMiner. A vendor-agnostic xOps platform for mission-critical operations. Skyline has offices in Belgium, Portugal, Singapore, Bosnia and Herzegovina, the UAE, and the USA, with a permanent presence on every continent.

1,500+ user organizations	**12,000+** nodes deployed
125+ countries	**9,000+** product integrations
1,000+ vendors supported	**350+** dedicated experts

Built for AI-native operations

- Your operators state the outcome they want. DataMiner agents work with third-party agents over A2A (agent-to-agent) to deliver it.
- Automation runs inside your guardrails. Your people stay in control.
- Your operation grows through the platform, and your people spend their time where judgment counts.

Built on continuous evolution

DataMiner has moved with the industry. From monitoring, to control, to automation, and now to AI-native operations that pair purpose-built machine learning with human decision-making. Same platform throughout.

Built for the future

The DataMiner xOps platform is the intelligence fabric for complex operational ecosystems. Start with monitoring and control of what you run today. The same platform takes you to AI-native operations when you are ready, without starting over.
